The Long-term Impact of Wind Power on Electricity Prices and Generating Capacity

BACKGROUND

- Over the coming decade, many countries are likely to experience a significant increase in the amount of wind generation.
- The European Union is committed to obtaining 20% of its energy from renewable resources by 2020. This may involve nearly seven times the current level of wind generation.
- The UK’s target for renewable energy is 15% of all kinds of energy consumption. Meeting the target could well require the addition of wind capacity.
- Output from wind generation is volatile since production is limited by the wind. Once wind power forms a significant part of an electricity market, this will feed through to short-run price volatility: when wind generation is high, prices will tend to be lower than normal, and when the wind is low, prices will tend to be higher.

METHODOLOGY

- The authors use a market equilibrium model to calculate how the mix of generating capacity would change if large amounts of intermittent renewable are built in Great Britain.
- The implications of the model for operating patterns and the distribution of prices over time are derived.

KEY FINDINGS

- If generators bid their marginal costs, changes to the capacity mix are much greater than changes to the pattern of prices.
- Thermal capacity falls only slightly in response to the extra wind capacity, and there is a shift towards power stations with higher variable costs but lower fixed costs.
- Changes to the pattern of prices, once capacity has adjusted, are relatively small.
- In an oligopolistic setting, strategic operators will choose lower levels of capacity.
- If wind output does not receive the market price, then mark-ups on thermal generation will be lower in a system with large amounts of wind power.
THE CCP
The ESRC Centre for Competition Policy (CCP), at the University of East Anglia, undertakes competition policy research, incorporating economic, legal, management and political science perspectives, that has real-world policy relevance without compromising academic rigour.

FOR MORE INFORMATION
The full working paper (11-4) and more information about CCP and its research is available from our website: www.uea.ac.uk/ccp

ABOUT THE AUTHORS
- Richard Green is Professor of Energy Economics in the Department of Economics at the University of Birmingham
- Nicholas Vasilakos is Lecturer in International Business in Norwich Business School at the University of East Anglia
